Nurse-designed
sternum and breast support
for women

Why the internal closure of the sternum needs protection from the outside:

Sternal wound infections:

Increased risk for women:

Chronic pain and pulmonary complications:

Average cost of sternal wound complications:

For a complete list of references see the white paper, "The clinical evidence for the use of the QualiBreath external chest support device as an adjunctive method to decrease postoperative complications", on www.qualiteam.com

Prevent complications, advance recovery, and decrease costs of health care.

Postoperative sternum and breast support

Decrease sternal wound infections:

QualiBra Advanced complements the internal closure by providing constant lateral stabilization of the sternum, and the patient can use the integrated pockets to reinforce support at peak internal thoracic pressure (e.g. coughing, sneezing, straining).

Vertical bands at each side of the bra cups prevent the pull of gravity and separate the breast tissue to keep the wound free from buildup of moisture and heat, which helps to protect the sternal wound from infection.

Decrease pain and pulmonary complications:

QualiBra Advanced reduces pain as the vertical bands permit easy, painless access to the wound while maintaining breast support.

The sternum and breast support is a constant reminder to the patient that her wound is being protected and it helps to encourage deeper breathing, coughing, and early mobilization.

Advance recovery and esthetic wound healing:

QualiBra Advanced allows the patient to have better control of pain and respiration, which helps to promote earlier mobilization and advance recovery.

The vertical bands keep the breast tissue gently away from the sternal wound which aids in more esthetic healing women of all ages will appreciate.

Improve wound care and protection beyond the hospital:

The middle adjustment bands allow for quick and straightforward access to the wound in emergencies, and for easy inspection and care without the need to open the bra or uncover the breasts.

Soft, elasticized cotton bra cups with no seams or labels against the skin, and an ultra-light ventilated chest band together with easily adjustable closures, provide exceptional comfort and enhance compliance for usage at home until the sternum and surgical wound heal.
